

# TUTORIAL 4:

## Correlation + network analysis

# Intro to OmicsAnalyst

- Web-based platform designed for data-driven multi-omics integration and visualization
- Designed to be accessible to bench scientists rather than bioinformatician
- Integrates well-established multivariate and univariate statistics with innovative visual analytics to support:
  - Integrative multi-omics analysis
  - Clustering and pattern discovery
  - Correlation analysis

# Requirements

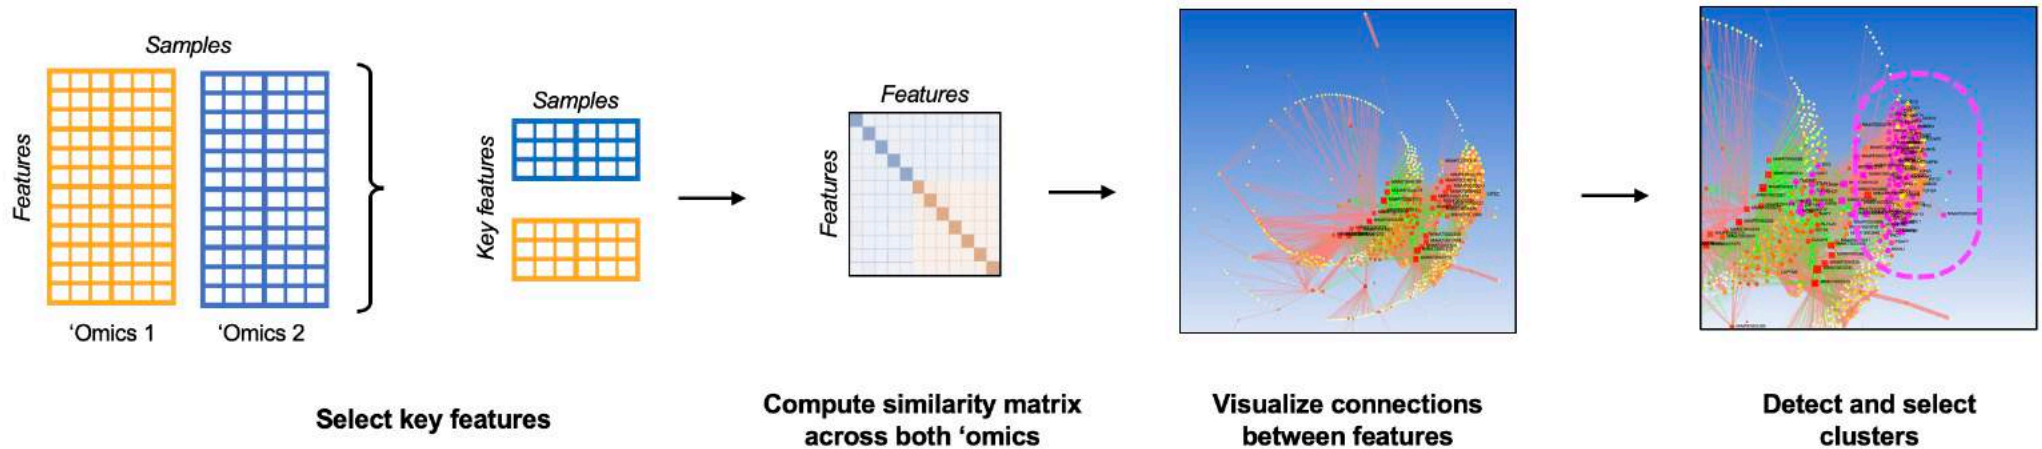

- Modern browser supporting WebGL.
- Ensure that WebGL is enabled in your browser!
  - Go to this page <https://get.webgl.org/> to verify your browser supports WebGL.
  - Refer to the FAQs for instructions on how to enable WebGL.
- For the best performance and visualization, use the latest version of Google Chrome.

# Goal for this tutorial

- A challenge for multi-omics analysis is to interpret highly complex and heterogeneous data without being overwhelmed by it
- Visualizing global patterns and clusters facilitate data interpretation
- The network analysis track focuses on presenting relationships within and between 'omics layers, to understand the correlation structures between features
- The goal of this tutorial is to:
  - Introduce OmicsAnalyst's tool for network analytics
  - Targeted analysis by performing functional enrichment analysis on selected regions from the example network

# Correlation analysis + network visualization

- An overview of this track is:

- To start the tutorial, click

**GET STARTED**

on the homepage

OmicsAnalyst currently supports transcriptomics, proteomics, metabolomics, microbiomics, and miRNA data. Human and mouse annotation are supported, but data from any species can be analyzed without annotation.

2  
Select 3<sup>rd</sup> dataset and click "Yes"

**Example Datasets**

Data	Description	Download
<input type="radio"/> Human pregnancy [2]	Human multi-omics data (proteomics, metabolomics) on modeling the chronology of these adaptations during full-term pregnancy. <a href="#">Multi-omics of pregnancy</a>	<a href="#">Proteomics</a> <a href="#">Metabolomics</a>
<input type="radio"/> Immune cells [3]	Mouse multi-omics data (transcriptomics, metabolomics, miRNA) on the effect of Ikaros transcription factor on B-cell differentiation from <a href="#">STATegRA</a>	<a href="#">Transcriptomics</a> <a href="#">Metabolomics</a> <a href="#">miRNA</a>
<input checked="" type="radio"/> Brain cancer [2]	Human multi-omics data (transcriptomics, miRNA) on glioblastoma multiforme of four different subtypes from <a href="#">TCGA</a> .	<a href="#">Meta-data</a> <a href="#">Transcriptomics</a> <a href="#">miRNA</a>

## Processing Individual Data

Currently selected data:

tcga\_mirna.csv

See options for different datasets by changing this menu

If unsure whether the data are already normalized, click the eye icon to view boxplots of the data. If the data are not extremely right skewed, it is generally safe to assume that they are already normalized.

Processing Step			Action
Annotation	Data value type	Raw	Submit ✓
	Omics type	miRNA	
	Specify organism	H. sapiens (human)	
	ID type	miRBase ID (v15+)	
Comparison	Choose a method	Limma	Submit ✓
	Fold change cutoff	1.0 (for two groups only)	
	P-value (FDR) cutoff	5.0E-5	

The main form shows processing parameters that were used for each dataset. When uploading data, it is important to correctly specify whether the data are raw counts or continuous values, as different data transformations should be used prior to differential analysis. See the FAQs for more details on the processing methods.

Proceed

Uploaded Data	
<input checked="" type="checkbox"/>	<b>tcga_gene.csv</b> Feature: 1560 Sample: 169 DE #: 490
<input checked="" type="checkbox"/>	<b>tcga_mirna.csv</b> Feature: 273 Sample: 169 DE #: 74

### Data Quality Check

The uploaded omics datasets are summarized below:

**Total number of samples:** 169  
**Group names:** Classical; Mesenchymal; Neural; Proneural  
**Individual datasets:** tcga\_gene.csv; tcga\_mirna.csv  
**Corresponding feature number:** 1560; 273

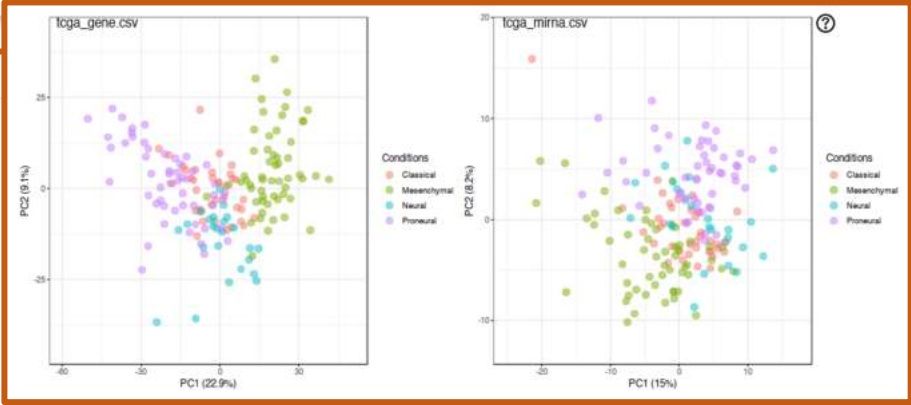

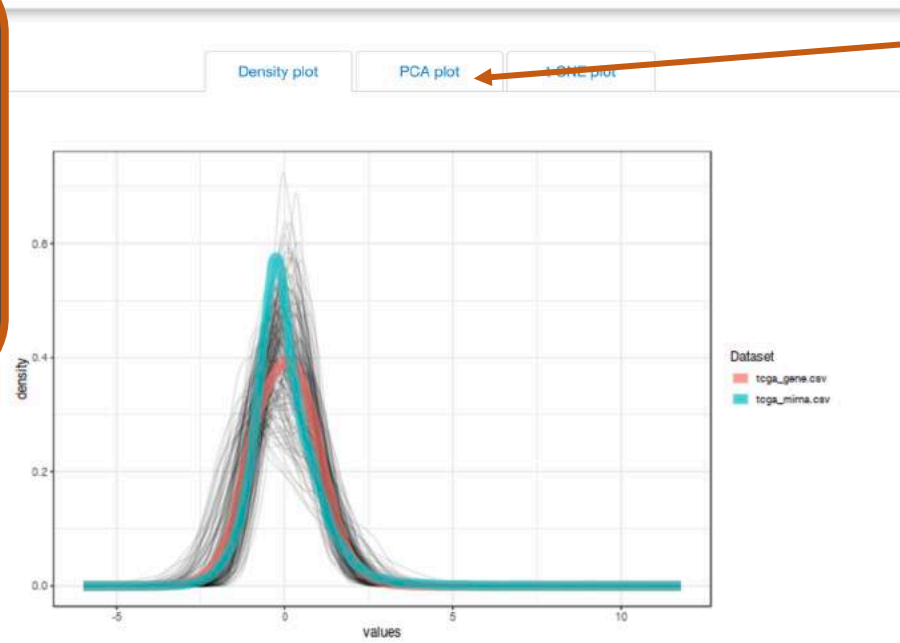

The density plot and PCA plots are generated to provide an overview of the omics datasets for quality control. The density plot shows the distributions across different omics layers. If the overall distribution seems to be in very different ranges, you should consider batch correction, accounting for batch effect prior to uploading your data to OmicsAnalyst, for example with the R package COMBAT.

**Current omics data:** tcga\_mirna.csv  
**Sample normalization:** None  
**Data transformation:** None  
**Data scaling:** Auto scaling

The page provides graphics to ensure that the data has been properly normalized. Since different transformation may be preferred compared to differential analysis, you can update the method here. Scaling the datasets so that have comparable distributions across 'omics types is recommended.

See the number of differential features from each dataset. Click the icon to update thresholds.

1 Look at the "PCA plot"

2 Click "Proceed"

Please choose a method to proceed

- Correlation Network Analysis
- Cluster Heatmap Analysis
- Dimension Reduction

The network analysis requires two selections: the first determines how key 'omics features will be selected, and the second determines how the network will be constructed from the key features.

Stay on "Correlation Network Analysis" tab

The objective of this analysis is to understand relationships between key features between two 'omics datasets. There are two ways to do this: either we select features that vary significantly across experimental groups using the differential analysis at the data upload step, or we select sets of features that are both highly connected within individual 'omics datasets and highly associated across 'omics datasets. For the second method, the top features from each component and 'omics data are selected based on the loading scores. Next, we compute the pairwise similarity of selected features. Various downstream edge and node filters are also provided to help further refine the network.

Feature selection method: Statistically significant features

Similarity matrix method: Spearman

Proceed

3

Click "Proceed"

2

Select "Statistically significant features" and "Spearman"

**Feature selection method:** This option selects key features to construct the correlation network based on the statistically significant features identified in the previous page. To change the number of seed features, click the **Editor icon** of the corresponding data on the left panel.

**Similarity matrix method:** classical Spearman correlation analysis is used to compute the pairwise similarity between selected features. Spearman correlation is a measure of the strength and direction of the monotonic relationship between two variables. It is rank-based, and therefore does not assume normality or linearity and can do a better job at representing non-linear relationships than the more commonly used Pearson correlation. The resulting pairwise Spearman correlations are used to form a network, where the nodes represent features and edges represent relationships between features.

### Network Tools

- Degree Filter
- Betweenness Filter
- Reset Network

Use the filters above to reduce the network size

### Analysis Overview & Parameter Tuning

The table below displays summary information on correlation networks generated using "sign". If network size is too large (i.e. over 1000 nodes) or too dense (i.e. over 2000 edges), some features are disabled. If network size is generally higher than between-omics, the default values are more stringent to avoid doing so.

Between-omics only:

Corr. threshold (between-omics): 0.5

Corr. threshold (within-omics): 0.8

Correlation sign: Both

Max. number of edges: 2000.0

Update

Correlation tends to be categorically greater between features of the same 'omics type than of different 'omics types. For this reason, there are separate thresholds for within and between 'omics pairings. Uncheck the box and set the within-omics threshold to 0.8

1

Click "Update"

2

### Network summary

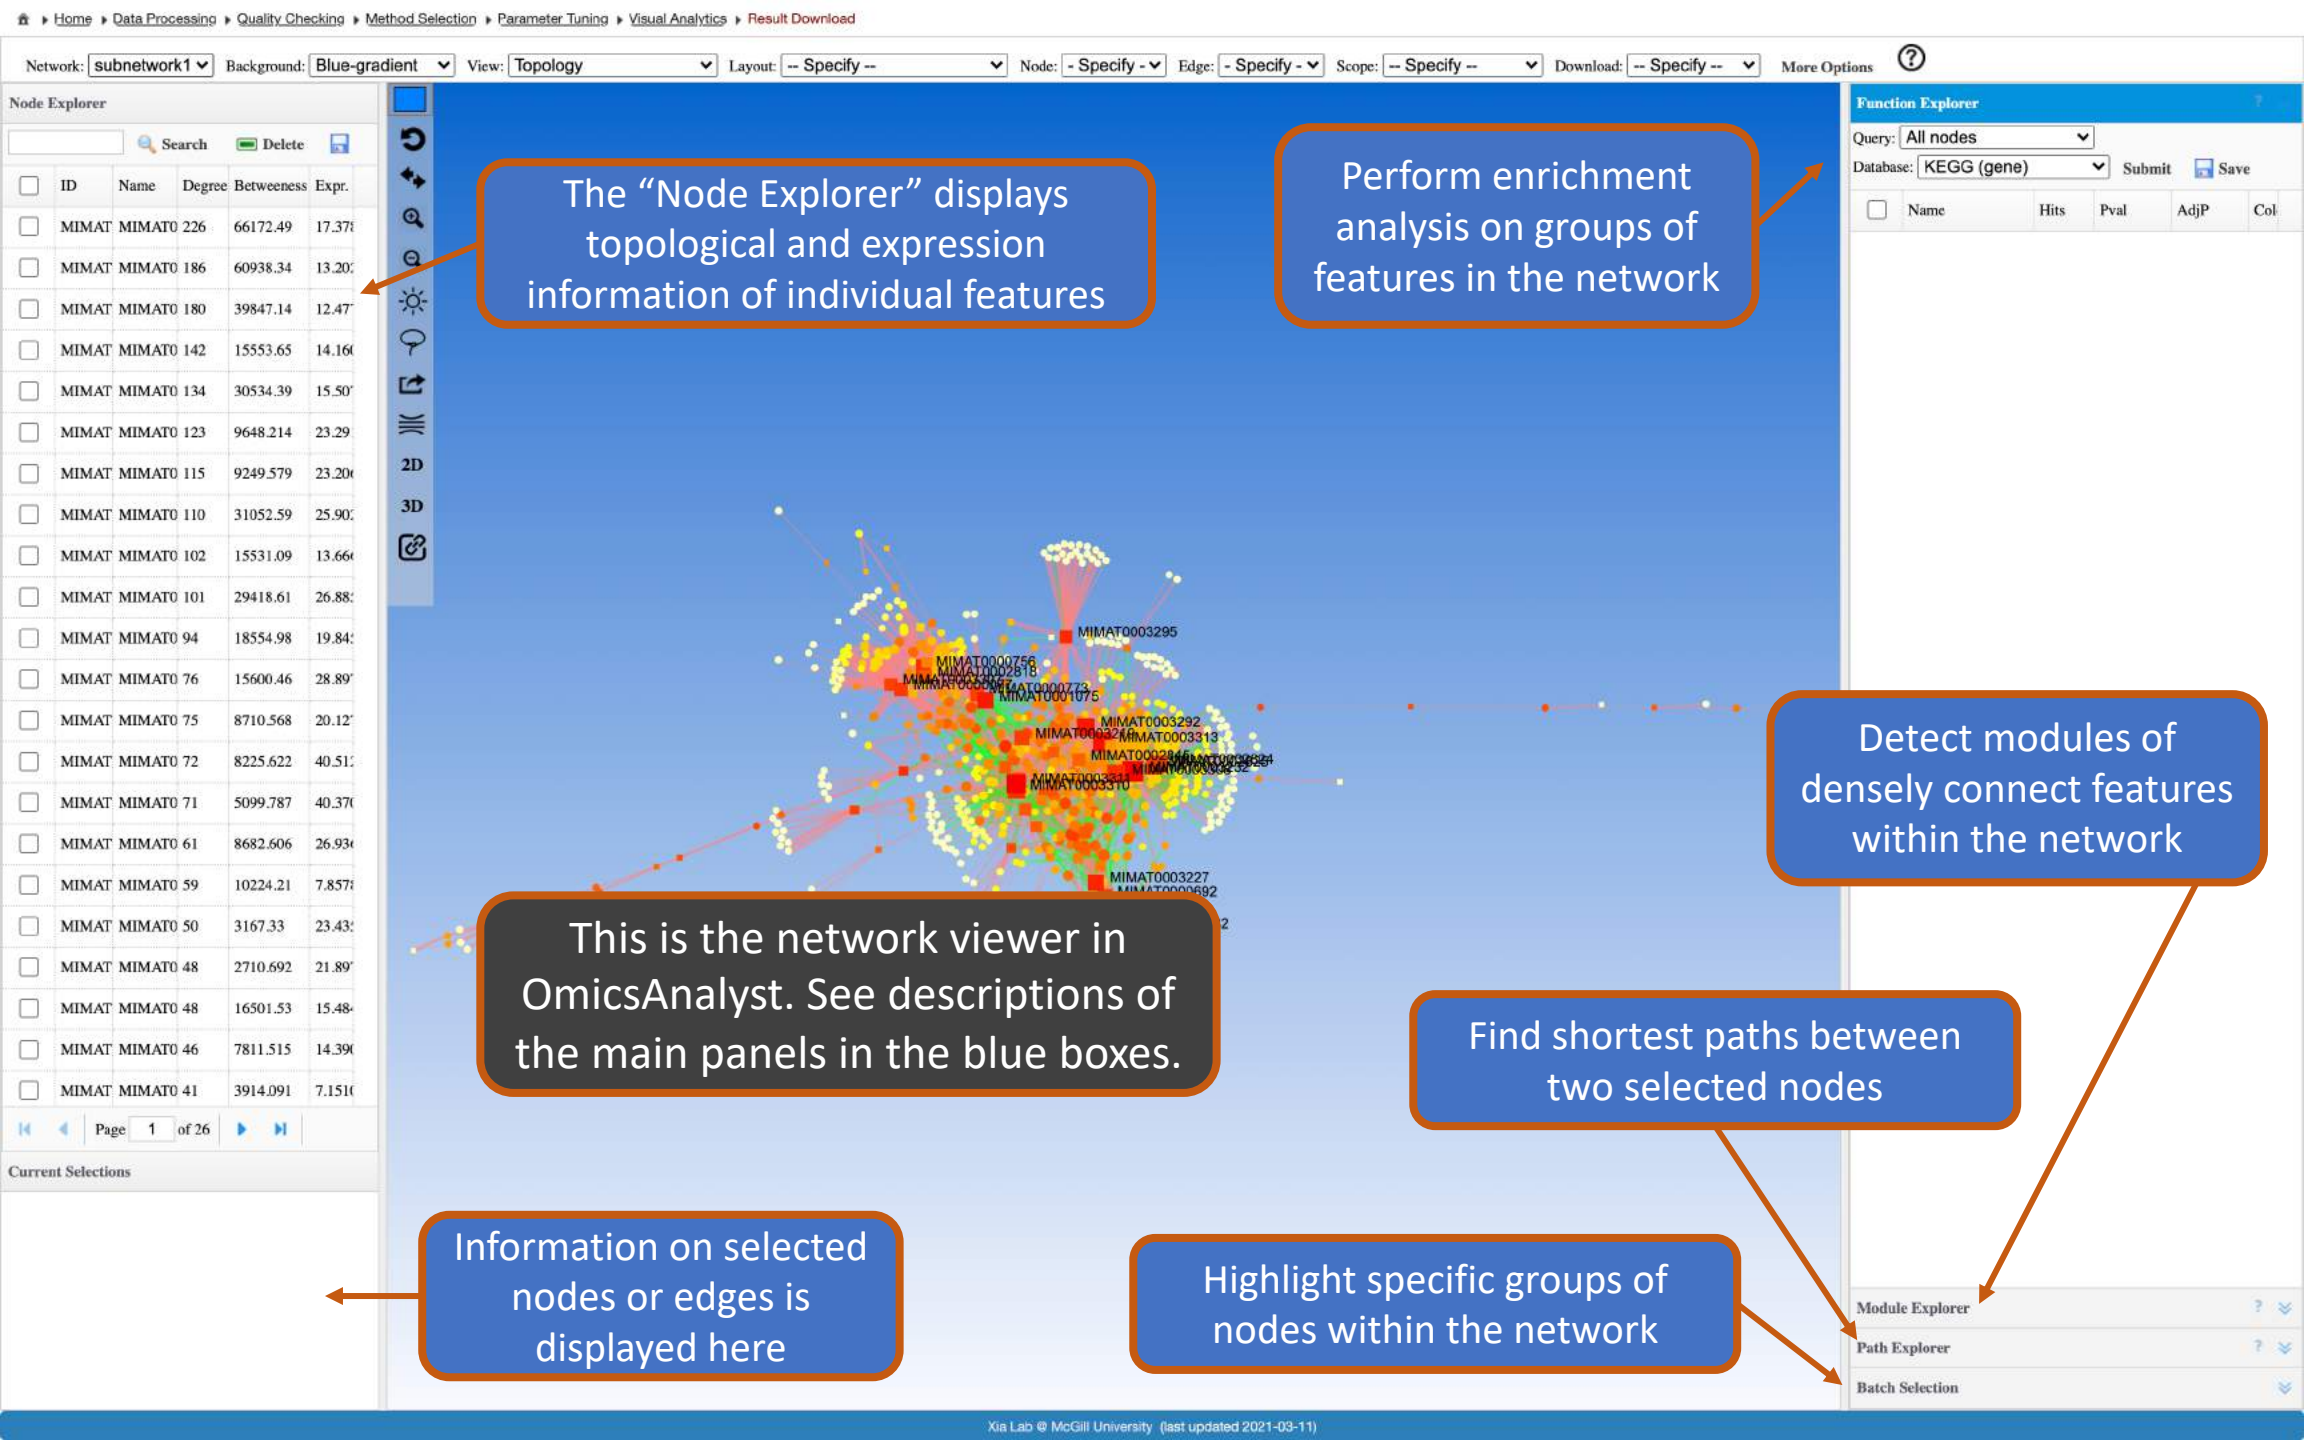

### Correlation

	miRNA: 1; Genes: 1;	1	Download

Networks with too many nodes and edges are difficult to visualize in a meaningful way, and so this page allows you to "prune" the network using various filters. For example, some advanced layout features are disabled for networks greater than 2000 edges, so in some cases you should refine the network.
